How to Make Pour Over Coffee at Home: A Beginner's Guide

Copperpot Coffee Roasters · 5 minute read

Pour over coffee has a reputation for being fussy. It isn't. You need a dripper, a filter, hot water and about four minutes. Get three numbers roughly right, the ratio, the grind and the temperature, and you will make a better cup than most cafes serve.

This guide shows you how to make pour over coffee step by step, and how to fix it when the first cup does not taste the way you hoped.

What you need

- A pour over dripper and matching paper filters
- Freshly roasted coffee, ideally whole bean
- A grinder (a burr grinder gives a more even grind than a blade)
- A kettle. A gooseneck spout helps, but any kettle works
- Kitchen scales and a timer
- A mug or small jug

Scales matter more than any other item on that list. Measuring by the scoop is the most common reason two cups made the same way taste different.

The pour over coffee ratio

Start with **1 gram of coffee for every 16 grams of water**. For one mug, that is 15 g of coffee and 240 g of water. A gram of water is a millilitre, so you can weigh everything on the same scales.

Cups	Coffee	Water	Total brew time
1 mug	15 g	240 g	2:30 to 3:00
2 mugs	30 g	480 g	3:00 to 3:30
Small jug	45 g	720 g	3:30 to 4:00

Prefer it stronger? Move to 1:15. Lighter? Try 1:17. Change one thing at a time so you know what made the difference.

Pour over grind size

Aim for a medium grind, about the texture of coarse sand. Finer than that and the water struggles to get through, which makes the coffee bitter. Coarser and the water runs straight through, leaving it thin and sour.

If you buy pre-ground coffee, ask for a filter grind.

How to make pour over coffee in six steps

1. **Heat the water.** Bring it to the boil, then let it stand for 30 seconds. You want it around 93 to 96°C.
2. **Rinse the filter.** Put the filter in the dripper and pour hot water through it. This removes any papery taste and warms the mug. Tip the rinse water away.
3. **Add the coffee.** Tip in your ground coffee, give the dripper a gentle shake to level it, and zero the scales.
4. **Bloom.** Start the timer and pour about twice the coffee's weight in water, so 30 g for 15 g of coffee. Wet all the grounds, then wait 30 seconds. The coffee will swell and bubble as trapped gas escapes.
5. **Pour slowly in circles.** Starting at the centre and spiralling out, pour steadily until the scales read your target weight. Try to reach it by about 1:45.
6. **Let it drain.** The water should finish dripping through between 2:30 and 3:00. Remove the dripper and drink.

Why bloom coffee? Fresh coffee holds carbon dioxide from roasting. If you skip the bloom, that gas pushes water away from the grounds and the cup tastes weak and uneven.

Fixing a cup that tastes wrong

It tastes	Likely cause	Try this
Sour or sharp	Water passed through too fast	Grind one step finer
Bitter or harsh	Water passed through too slowly	Grind one step coarser
Weak or watery	Not enough coffee	Move from 1:16 to 1:15
Flat or dull	Coffee is stale, or water too cool	Check the roast date and use hotter water

Pour over vs drip coffee: what is the difference?

Both run hot water through ground coffee and a filter. A drip machine does the pouring for you, at a speed and temperature you cannot change. With pour over you control both, which is why the same beans can taste clearer and sweeter. The trade-off is that it takes your attention for three minutes.

Frequently asked questions

Do I need a gooseneck kettle?

No. It makes a slow, accurate pour easier, but you can get a good cup from a normal kettle by pouring gently and close to the coffee.

How fresh should the coffee be?

Coffee is usually at its best between one and four weeks after the roast date. Look for a roast date on the bag, not just a best-before date.

Can I use pre-ground coffee?

Yes. It will lose flavour faster than whole beans, so buy small bags and keep them sealed, away from heat and light.

Ready to brew?

Start with 15 g of coffee, 240 g of water and a medium grind. Taste it, change one thing, and try again tomorrow. By the end of the week you will have a recipe that is yours.

Need beans to practise with? Our sampler box has four roasts to try side by side.

SEO notes delivered with the article

- **Target phrase placement:** title tag, H1, first 100 words, one H2 and the closing section. It reads naturally in each spot.
- **Supporting phrases:** each one has its own H2 or callout (ratio, grind size, pour over vs drip, bloom), so the page can answer related searches.
- **Structure:** one H1, H2 for each main section, H3 only inside the FAQ. No skipped levels.
- **Featured snippet targets:** the numbered six-step list and the two tables are formatted the way search engines lift into answer boxes.
- **FAQ section:** three real questions, ready for FAQPage schema markup.
- **Internal links to add:** sampler box product page (closing call to action), grinder guide, and coffee storage article.
- **Image suggestions with alt text:** "pour over dripper on a mug with scales", "medium coffee grind next to coarse sand for comparison", "blooming coffee in a paper filter".
- **Readability:** short paragraphs, plain words, UK spelling to match the client's site.

What the client would review before publishing: the brew ratio and temperatures are widely used starting points, but the client should confirm them against their own house recipe, and confirm the product named in the call to action.
